T125 is predicted to have no transmembrane domains and appears to be a secreted protein. The sequences of all variants of T125 are used in the invention to create antibodies which selectively bind to T125. The T125 polypeptide is used to modulate a variety of cellular processes. It can be used to produce fusion proteins. The protein may also be used to produce antibodies, and to identify T125 antagonists and agonists. The T125 polypucleotides, polypeptides, homologues and antibodies can be used in screening assays; predictive medicine; and methods of treatment of T125 associated disorders. The T125 polypucleotides can be used to express the protein; to detect T125 mRNA; to detect genetic alterations in the T125 gene; in forensic biology; and as a source of primers and probes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This polypeptide comprises human Zneul mature polypeptide. Zneul is a new neuro-growth factor-like protein (see also W88381). Its closest human homologue is HSMHC3M5A, a gene in the HLA class III region, which is contained in a cosmid which contains Notch 4. Zneul is also homologous to Notch 4 in its ECF-like domains and may be involved in ECF receptor pathways. Zneul is widely expressed in adult tissues, with high expression in heart, placenta, spleen, testis, thyroid, spinal cord and lymph node. Zneul can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. It may play a role in breast cancer, glioblastomas, and pituitary play a role in breast cancer, glioblastomas, and pituitary play a role in breast cancer, glioblastomas, and pituitary cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of diagnostic assets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

CC represent the human ORFX open reading frames 1 to 3161. The ORFX CE sequences have activitles such as: cytostatic; hepatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; mootropic; neuroprotective; osteopathic; cc anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; CC cardiant: thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; cd dermatological; immunosuppressive; antiinflammatory; antibacterial; CC antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The cc sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an CC ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative cdisorders osteoarthritis, graft vs host disease, cardiovascular disease, storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.

                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 233891 to 234338, and Y41685 to Y41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   18 MAY 1998

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 23891 to 234338, and v41685 to y41714 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                            Homo

                                                                                                                                                                                                                                                                               The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 233891 to 234338, and Y41685 to Y41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           15 MAY -1998;

Chaudhry A.Z., Lyons G.E., Gronostajski R.M.;
Expression patterns of the four nuclear factor I genes during mouse embryogenesis indicate a potential role in development.";
Dev. Dyn. 208:313-325(1997).
-I- FUNCTION: CTF/NF-I RECOGNIZE AND BIND THE PALINDROMIC SEQUENCE 5'-
TTGGCUNNINGCCAA-3' PRESENT IN VIRAL AND CELLULAR PROMOTERS AND IN
THE ORIGIN OF REPLICATION OF ADENOVIRUS TYPE 2. THESE PROTEINS ARE
INDIVIDUALLY CAPABLE OF ACTIVATING TRANSCRIPTION AND REPLICATION.
-I- SUBGUITT: BINDS DNA AS AN HOMODIMER.
-I- SUBCELLULAR LOCATION: NUCLEAR.
-I- ALTERNATIVE PRODUCTS: DIFFERENT FORMS OF CTF/NF-I CAN BE PRODUCED
BY DIFFERENTIAL SPLICING OF THE SAME GENE.
-I- SIMILARITY: BELONGS TO THE CTF/NF-I FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SEQUENCE FROM N.A.

Nucleic Acids Res. 18:2607-2616(1990).

-I- FUNCTION: CTF/NF-I RECOGNIZE AND BIND THE PALINDROMIC SEQUENCE 5'-TTGGCNNINNGCCAA-3' PRESENT IN VIRAL AND CELLULAR PROMOTERS AND IN THE ORIGIN OF REPLICATION OF ADENOVIRUS TYPE 2. THESE PROTEINS ARE INDIVIDUALLY CAPABLE OF ACTIVATING TRANSCRIPTION AND REPLICATION.

-I- SUBGUNIT: BINDS DNA AS AN HOMODIMER.

-I- ALTERNATIVE PRODUCTS: DIFFERENT FORMS OF CTF/NF-I CAN BE PRODUCED BY DIFFERENTIAL SPLICING OF THE SAME GENE.

-I- MISCELLANEOUS: IN CHICKEN NEIT-INGGCA PROTEINS ARE ENCODED BY ATTERSET TRUSTED AND NEIT-OF A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            01-NOV-1990 (Rel. 16, Created)

BETA-1.4 -MANNOSYL-GLYCOPROTEIN BETA-1, -ACETYLGLUCOSAMINYL-
TRANSFERASE (EC 2.4.1.144) (N-ELYCOSYL-OLICOSACCHARIDE-GLYCOPROTEIN
N-ACETYLGLUCOSAMINYLTRANSFERASE III) (N-ACETYLGLUCOSAMINYLTRANSFERASE
III) (GNT-III) (GLCNAC-T III).
RATTNO --
      UDP-N-acetylglucosamine: beta-D-mannoside
beta-1,4N-acetylglucosamine; beta-D-mannoside
J. Biol. Chem. 267:18199-18204(1992).
J. Biol. Chem. 267:18199-18204(1992).
I Biol. Chem. 267:18199-18204(1992).
I FUNCTION: IT IS INVOLVED IN THE REGULATION OF THE BIOSYNTHESIS AN
BIOLOGICAL FUNCTION OF GLYCOPROTEIN OLIGOSACCHARIDES. CATALYZES
THE ADDITION OF N-ACETYLGLUCOSAMINE IN BETA 1-4 LINKAGE TO THE
BETA-LINKED MANNOSE OF THE TRIMANNOSYL CORE OF N-LINKED SUGAR
CHAINS. IT IS ONE OF THE MOST IMPORTANT ENZYMES INVOLVED IN THE
REGULATION OF THE BIOSYNTHESIS OF GLYCOPROTEIN OLIGOSACCHARIDES.
I-CATALYTIC ACTIVITY: UDP-N-ACETYL-D-GLUCOSAMINE + N-ACETYL-BETA-D-
                                                                                                                                                                                                                                                                                                                                                                     GNT3_RAT

**Predominant neuronal expression of the gene responsible for dentatorubral-pallidoluysian atrophy (DRPLA) in rat.";

*Hum. Mol. Genet. 4:1619-1624(1995).

-I- TISSUE SPECIFICITY: PREDOMINANT NEURONAL EXPRESSION, ALTHOUGH MARKEDLY REDUCED AMOUNTS ARE FOUND IN MOST OTHER TISSUES.

-I- DEVELOPMENTAL STAGE: SIMILAR EXPRESSION AT ALL DEVELOPMENT STAGES (DAY 14.5 P.C., 17.5 P.C., NEWBORNS AND ADULTS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-OCT-1996
